1 PROBLEM STATEMENT

Design a Front End

Details:

- Implement the design from the following image: <http://bit.ly/frontendimage>
- Make it responsive.
- All files should be concatenated, minified or otherwise generally optimized.
- Any image / text content can be used but the look and feel of the image needs to be captured.
- Write an additional document with a structure of your submission directory and any instructions to build / run your code. The root structure we would recommend is: Directory
 - dist (Concatentated and minified files)
 - index.html
 - [any build tool files]
 - src (Source files)

2 FRAMEWORK

I have used Bootstrap framework to build the front end part.

3 INSTRUCTIONS

Please navigate to the main directory. I have run the code in Linux machine.

Directory Structure looks like:

```
-dist
-src
-index.heml
```

- You will just have to run index.html page in your browser.
- Can be run into your server custom folder.
- In linux put the folder into /var/www/html.
- Open your browser and go to localhost/<direc_name>
